

School-Work experience final report

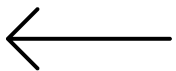

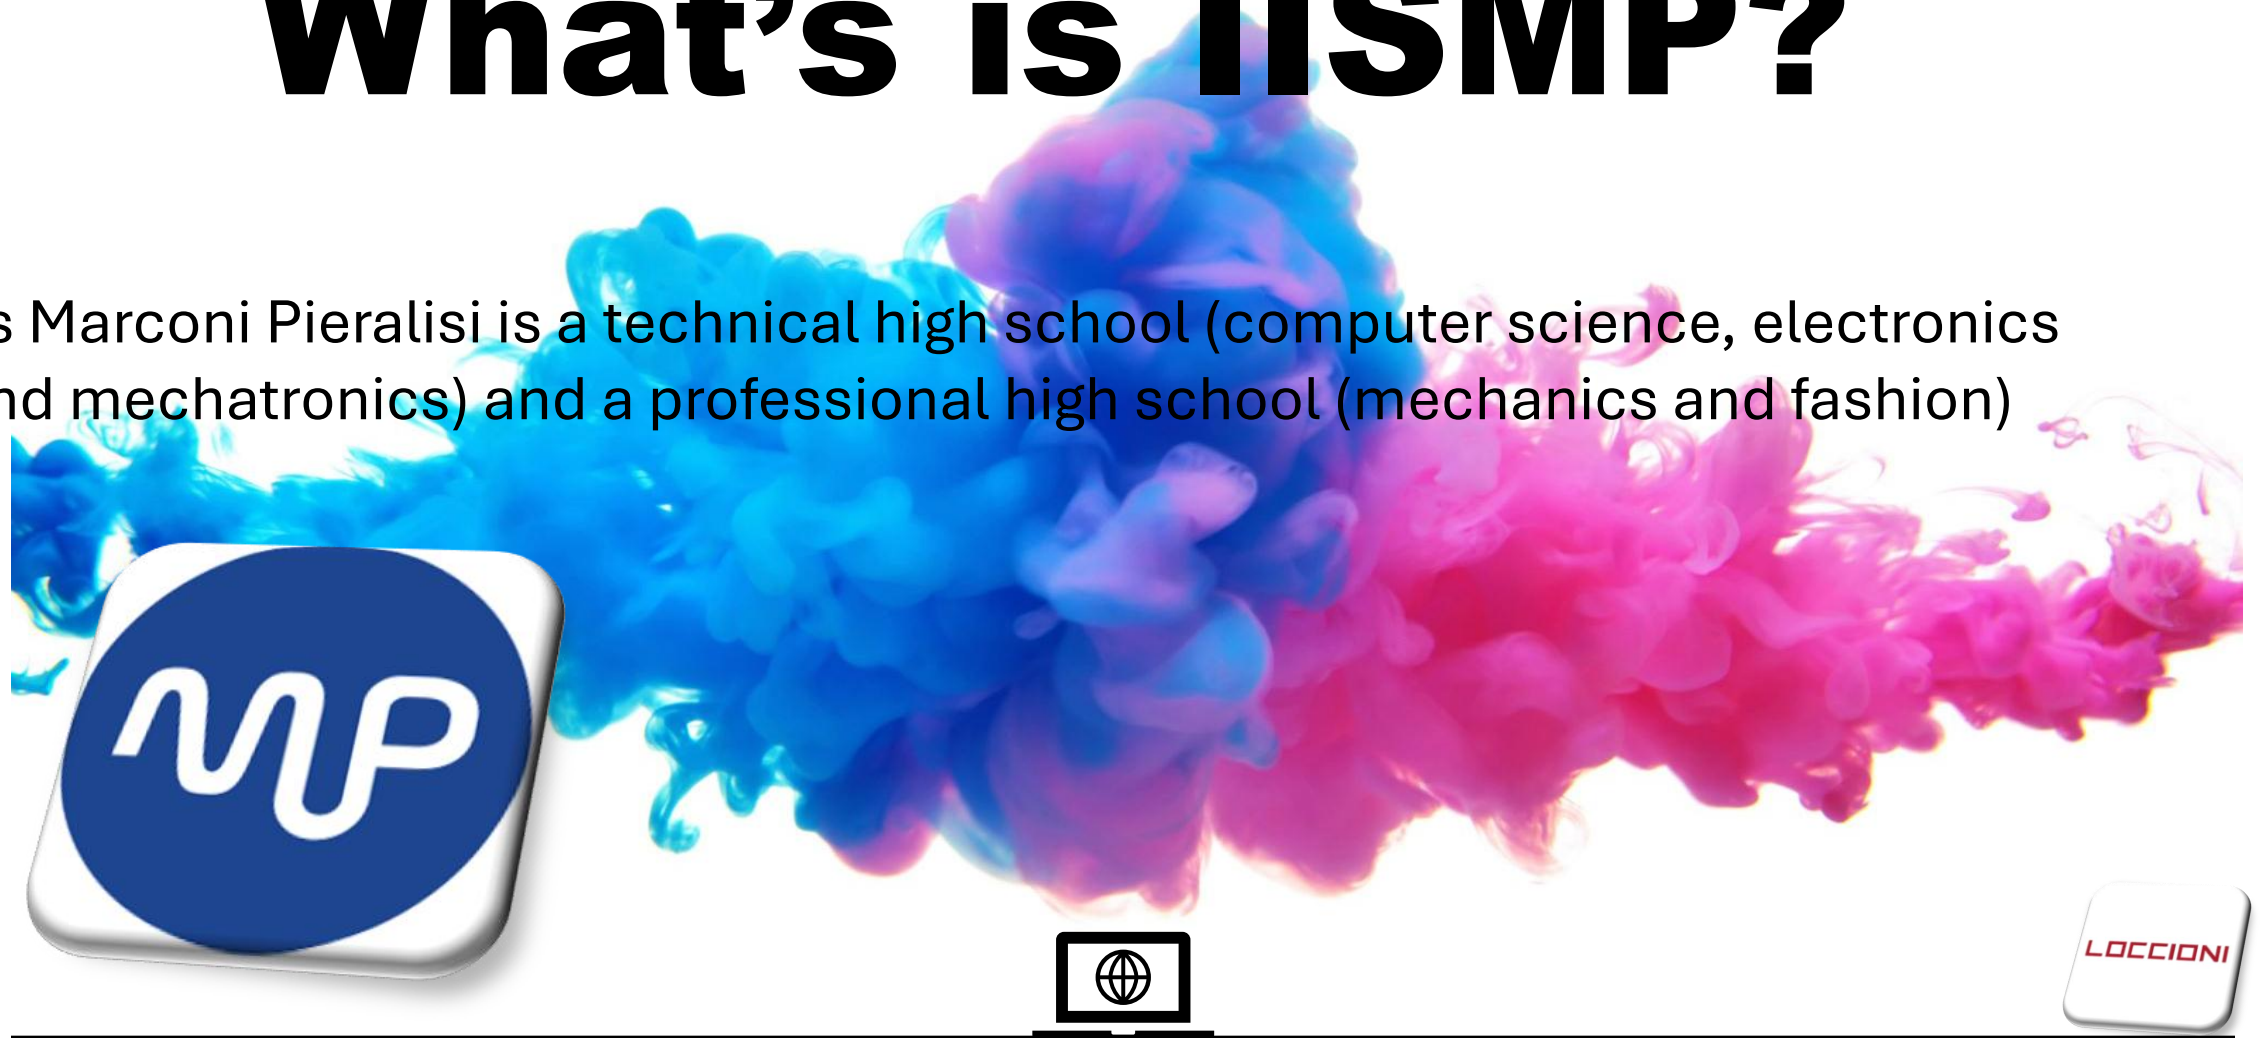

What's is loccioni?

Loccioni is a large international company that produces test benches for major manufacturers of various products

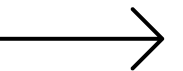

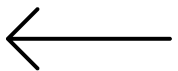

What's is IISMP?

Iis Marconi Pieralisi is a technical high school (computer science, electronics and mechatronics) and a professional high school (mechanics and fashion)

The main points

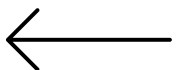

- The company, association, enterprise you were working with, at and the organisation in departments and areas and the type of welcoming you were given by the boss, workers and tutor.
- The type of company you were working at:
 - if a service company, indicate who is the customer and give details about the supply and distribution procedures.
- The activities carried out by the sector / department / area you were in.
- Tasks performed and professional areas / topics / aspects you focused on.
- What you realised about your ability to complete the given tasks in the requested / established times.
- What you realised about your carrying out tasks by yourself.
- What you understood about your ability to work in a team.
- What you learnt about yourself.
- If your expectations about the school-work experience, were confirmed and their impact on your future educational and/or professional career.
- Difficulties / problems in the new work environment and the way you faced and overcame them.
- Tools, equipment, devices used (known or not).
- Participation level: specify your role (assistance, cooperation, individual work).

THE FIRSTS THREE POINTS.

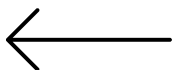

They have a very well-organized welcome system for both employees and important clients. My experience started with a winter training period (January-March). After selecting students, the company held training sessions twice a week after school. These sessions included one hour of theory and three hours of practical laboratory work to understand the company's various sectors. After this training, in May, we began the standard PCTO period. We were divided into two teams, each led by a Project Manager (PM). I was the PM for one team, which worked on the software part of our assigned project. The main task was to create a software application in C#, but the rules, guidelines, and difficulty level were completely different from school.

THE SECONDS TWO POINTS.

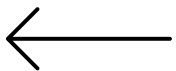

My tasks were similar to school programming but with a totally different method. We worked in C# but used a framework created by Loccioni called "Aulos", which adds structures to Visual Studio. As far as my role is concerned, being the PM meant I had to both program and coordinate all parts of the project (hardware and software). In terms of my abilities, I realized I have good organizational logic for managing a project of this scale, but I also need to gain much more experience in programming.

THE THIRD THREE POINTS.

This experience offered aspects that school cannot, like managing our time and work methods independently (for the software part), although we always had trainers available for help. My ability to work in a team is good because I don't pressure others and I am good at coordinating work according to the required standards. As far as I am concerned, I learned that I can get discouraged too easily when things don't go as planned, but teamwork helps with mutual support, including boosting morale. I also understood what kind of work environment I prefer: a serene yet formative and competitive international company like Loccioni.

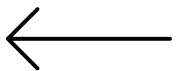

THE PENULTIMATE TWO POINTS.

My expectations were not only confirmed but greatly exceeded, thanks to the professionalism of the trainers and how they included us in their work. This experience will have a significant and positive impact on my future career, as I saw firsthand how a large multinational company works. It will also positively impact my schoolwork, as programming problems now seem less impossible. All difficulties were overcome, both through my hard work and the constant support from the trainers. The most difficult ones initially caused some discouragement, but I improved my psychological approach and now face any challenge with motivation.

The tools we used were similar to school but updated; for example, we used Visual Studio 2022 instead of 2017. To use the "Aulos" framework and interface with hardware like a robot and cylinders, we used completely new components. Initially, it was challenging, but once we got used to it, everything went smoothly. So, we used totally new components, but no special tools were needed for our core programming work

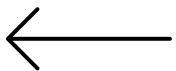

THE ULTIMATE TWO POINTS.

My level of participation was very high. Not only did we have to program, but we also had to interface with other areas we knew nothing about, which required a lot of attention and interest. The relationship with the trainers and the company tutor was fantastic. They were all very young and approachable people who didn't make me feel intimidated.

I have no suggestions for improvement regarding the company. As far as the support from the school tutor is concerned, it was very scarce. This was a negative aspect. For example, when I had school debts and simultaneously had to attend the training period at Loccioni, I found myself essentially alone. Both the school coordinator and the school tutor basically told me it was my problem when I asked for help, so I had to manage everything by myself. There was a clear lack of support from the school side.

Thanks for your attention!!
